

Timeline

What is 400 Day Weight?

- The liveweight of an animal at approximately 400 days after birth.
- A measure of animal's growth from birth to 400 days (yearling).
- Measured in kilograms (kg) to the nearest kg.

When to Record 400 Day Weight?

- Can be measured within the age range of 301 to 500 days after birth to accommodate management practices:
 - A weighing date should be chosen such that the average group age is approximately 400 days after birth.
 - Weigh ALL yearlings on the same day.
 - BREEDPLAN will correct for the number of days prior to or post 400 days within this age range.

400 Day Weight EBV

- Estimate of the genetic differences between animals in liveweight at 400 days of age due to their genetic potential for growth.
- A prediction of the animal's genetic potential for growth to yearling (400 days).
- Reported in kilograms (kg).
- The larger the group of animals weighed together for 400 Day Weight, the more accurate the 400 Day Weight EBV.
- Important for breeders turning animals off as yearlings.

Interpreting 400 Day Weight EBVs

- Larger, more positive 400 Day Weight EBVs are generally more favourable, for example:
 - A bull with a 400 Day Weight EBV of +50 kg would be expected to produce heavier calves at 400 days of age (or yearling) compared to a bull with a 400 Day Weight EBV of +30 kg.

Why Record 400 Day Weight?

- Live weight is an important economic factor.
- Recording 400 Day Weight enables BREEDPLAN to calculate 400 Day Weight EBVs.
- Weight EBVs (Birth Weight, 200 Day Growth, 400 Day Weight, 600 Day Weight and Mature Cow Weight) are genetically correlated.

How Many 400 Day Weight Measurements does BREEDPLAN Use?

- BREEDPLAN analyses up to two 400 Day Weight measurements to calculate the 400 Day Weight EBV.
- It is not required to record two 400 Day Weight measurements, however this will increase the accuracy of the 400 Day Weight EBV.
- If two 400 Day Weight measurements are recorded, BREEDPLAN recommends a minimum of 30 days between each measurement and that all animals in the group are weighed both times.
